

Secure Remote Access Solution for every device

HAG is suitable for you, if you wish to enable secure access, facilitate 2FA and SSO, and have an easy-to-integrate solution

HAG can help you secure

- Web Applications
- Web Services
- Cloud applications
- Cloud services
- Thick applications

Nexus offers a unique, cloud-integrated solution – a virtual appliance that is standards-based and independent of platform and device.

Nexus Hybrid Access Gateway unifies the best abilities of several proven solutions to promote more flexible working solutions, while providing secure access for your employees, partners and customers beyond the boundaries of the corporate network.

Nexus Hybrid Access Gateway (HAG) supports Bring Your Own Device (BYOD) with functionality that is simple, secure and user-friendly.

Features

- Off-the-shelf support for a wide range of two-factor authentication (2FA) methods, such as mobile apps, one-time passwords (OTP), smart cards, or software tokens.
- Cloud identity – a pluggable 2FA service for online portals and cloud services.
- Identity federation – the users' electronic identities and attributes are linked and stored across multiple distinct identity management systems.
- Single sign-on (SSO) – a user's single authentication token is trusted across multiple IT systems or even organizations.
- Registration with existing enterprise IDs, in for example Microsoft's directory service Active Directory.
- Ability to use eIDs you issue to your customers, employees, students, or citizens.

The gateway supports a wide choice of user-friendly 2FA and provides powerful identity federation, enabling users to log on just once to reach all managed resources.

It creates exceptional security by implementing four steps for your protection:

- Authentication of user identity
- Authorization to access applications
- Access through an encrypted connection
- Audit of user activity

Greater ease for users

Nexus Hybrid Access Gateway is platform independent hence, there's no need for application downloads or installations on the client hardware. The responsive web portal senses each user's device and optimizes to offer consistent user-experience

Unification of Access

Nexus Hybrid Access Gateway provides a single end-user view that can be set to offer access to private applications such as Facebook and Twitter, as well as to enterprise applications deployed on the enterprise network as cloud services. This unified access approach means that risk-appropriate authentication methods can easily be deployed, all at once, with a few simple configuration steps.

Greater security, less administration

Nexus Hybrid Access Gateway simplifies your administration, while increasing flexibility and choice. Communication is encrypted for optimal security, and strong authentication is ensured because only authorized users gain access. A key benefit of the solution is that no critical information enters the user's device and nothing is stored on the device after the session is completed.

Why Hybrid

The enormous potential of cloud-deployed applications is forming a new type of architecture, called the hybrid-connected enterprise. The ability to place applications in the cloud and on premises makes them easier to reach and simultaneously cuts administration. Our Hybrid solution also ensures that applications can be accessed securely because user identities and authentication are transferred between security domains.
